History AutoCAD was originally an AutoCAD LT (LT) add-on application called AutoCAD LT Architecture, released in 1992. In 1994, AutoCAD was acquired by Autodesk, which in turn acquired AutoCAD LT in 2000. Dental restorative materials are unique in their clinical function as an interface between two physiological systems (i.e. the oral and the systemic) and, therefore, they can be used as vehicles for the local and/or systemic delivery of therapeutics. Thus, dental restorative materials are ideal vehicles for the delivery of therapeutic agents that have previously not been used in dental research, mainly due to their inherent characteristics. The purpose of this article is to provide an overview of the current research regarding the use of dental adhesives in dental research and to report on possible therapeutic agents that have been incorporated into dental adhesives and their effect on adhesion, polymerization, and subsequent remineralization.Prognosis of a splenic artery aneurysm with a review of the literature. Field of the Invention The present invention relates to control of an air-fuel ratio of an engine and, more particularly, to a fuel injection control apparatus and method for an engine that are designed to attain both higher fuel efficiency and exhaust emission performance, by optimally controlling the air-fuel ratio, without variation of the control range even when engine characteristics (e.g., engine speed) vary. 2. Description of the Related Art In general, the amount of fuel to be supplied to an engine is determined from the required fuel-injection amount of the engine, with consideration given to the fuel efficiency and exhaust emission characteristics of the engine. That is, an amount of fuel corresponding to a fuel-injection amount is previously determined based on engine characteristics (e.g., an engine speed or rotational speed of an engine) at the time of fuel supply, a previously determined fuel injection amount at the time of fuel supply being set in a form corresponding to engine conditions, such as the engine speed, at the time of fuel supply. The engine conditions at the time of fuel supply include, for example, engine revolutions or engine rotational speed. In order to set the fuel injection amount of an engine, a fuel injection time $t_{sub.1}$ or a fuel injection quantity $q_{sub.1}$ may be measured in accordance with the above fuel injection amount. In a conventional control, a basic fuel injection time $T_{sub.B1}$ or a basic fuel injection quantity $Q_{sub.B1}$ is set as the above fuel injection time $t_{sub.1}$ or fuel injection quantity $q_{sub.1}$. A factor indicating the amount of air taken into a cylinder of the engine and an amount of fuel burned in the cylinder is set in accordance with the engine conditions at the time of fuel supply, such as the engine speed and engine revolutions, as an amount of air of a fuel mixture. An amount of air and an amount of fuel taken into a cylinder are detected by an air flowmeter and a fuel flowmeter, respectively. The basic fuel injection time $T_{sub.B1}$ or basic fuel injection quantity $Q_{sub.B1}$ and the amount of air or amount of
