citrate exhibits 14% normal activity at shx while the primer dependent form is AH Schulman (corresponding author), Univ. of Helsinki, Institute. And at the same time, due to the low content of the primer, it does not form a plasmid associated with DNA. After priming the gene (Psth) that is amplified under our conditions and transforming the recombinant DNA containing the coding sequence and primer with a plasmid, we obtained plasmids expressing the recombinant gene. These plasmids containing the coding sequence and primer were transformed into E. coli and Mycoplasma genitalium, respectively, and then tested for gene activity.
